

we can use function to model data / real-world issues

why we want to do that?

The benefit is: — Make future predictions / estimation

Use **Derivatives** to solve it

{ — Find some optimal value of the function. For example: Find the number of items that a company should produce to maximize their profit.

A, B, C, D, E, F are called local extrema of the function.

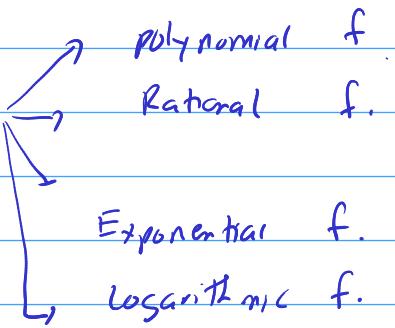

We can use "Derivatives" to find these points for a given function

Points A, C, E: local max where the 1st derivatives are zeros and 2nd derivatives are negative

Points B, D, F: local min 1st derivative are zeros and 2nd derivatives are positive.

Derivatives

we will cover the following functions:

Rule 1 (power rule)

The derivative of $f(x)$ is denoted by $f'(x)$

$$\begin{aligned}f(x) &= x^n \\ \Rightarrow f'(x) &= n \cdot x^{n-1}\end{aligned}$$

Example: Find $f'(x)$

$$\textcircled{1} \quad f(x) = x^4 \Rightarrow f'(x) = 4 \cdot x^{4-1} = 4x^3$$

$$\textcircled{2} \quad f(x) = x^{2024} \Rightarrow f'(x) = 2024 \cdot x^{2024-1}$$

$$= 2024 \cdot x^{2023}$$

$$\begin{aligned}\textcircled{3} \quad f(x) &= x^{\frac{1}{2}} = x^{\frac{1}{2}} \Rightarrow f'(x) = \frac{1}{2} \cdot x^{\frac{1}{2}-1} = x^{-\frac{1}{2}} \\ &\Rightarrow f'(x) = \frac{1}{2}\end{aligned}$$

$$\begin{aligned}\textcircled{4} \quad f(x) &= \sqrt{x} = x^{\frac{1}{2}} \\ \Rightarrow f'(x) &= \frac{1}{2} \cdot x^{\frac{1}{2}-1} = \frac{1}{2} \cdot x^{-\frac{1}{2}}\end{aligned}$$

$$\textcircled{5} \quad f(x) = \sqrt[3]{x} = x^{\frac{1}{3}}$$

$$f'(x) = \frac{1}{3} x^{\frac{1}{3}-1} = \frac{1}{3} x^{-\frac{2}{3}}$$

$$\text{In general: } f(x) = \sqrt[n]{x} = x^{\frac{1}{n}}$$

$$f'(x) = \frac{1}{n} \cdot x^{\frac{1}{n}-1}$$

Assignment 12

Find $f'(x)$

$$\textcircled{1} \quad f(x) = x^{1000}$$

$$\textcircled{5} \quad f(x) = \sqrt[4]{x}$$

$$\textcircled{2} \quad f(x) = x^3$$

$$\textcircled{6} \quad f(x) = \sqrt[5]{x}$$

$$\textcircled{3} \quad f(x) = x^7$$

$$\textcircled{7} \quad f(x) = x^{\frac{2}{3}}$$

$$\textcircled{4} \quad f(x) = x$$

$$\textcircled{8} \quad f(x) = x^{\frac{7}{3}}$$

Show all the work
as in the example.

$$\textcircled{9} \quad f(x) = x^{-6}$$

$$\textcircled{10} \quad f(x) = \frac{1}{x} \quad (\text{extra credit})$$

Do not just give the final
answer.

Example:

$$\textcircled{1} \quad f(x) = \frac{1}{x} = x^{-1}$$

$$f'(x) = -1 \cdot x^{-1-1} = \boxed{-x^{-2}}$$

$$(2) f(x) = \frac{1}{x^3} = x^{-3}$$

$$f'(x) = -3 \cdot x^{-3-1} = -3x^{-4} \quad \square$$

$$= -\frac{3}{x^4}$$

$$(3) f(x) = \frac{1}{x^{2024}} = x^{-2024}$$

$$f'(x) = -2024 \cdot x^{-2024-1}$$

$$= -2024 \cdot x^{-2025} = -\frac{2024}{x^{2025}}$$

$$(4) f(x) = \frac{x^3}{x^9} = x^{3-9} = x^{-6}$$

$$f'(x) = -6 \cdot x^{-6-1} = -6x^{-7} = -\frac{6}{x^7}$$

$$(5) f(x) = \frac{1}{\sqrt{x}} = \frac{1}{x^{1/2}} = x^{-1/2}$$

$$f'(x) = -\frac{1}{2} \cdot x^{-1/2-1} = -\frac{1}{2} \cdot x^{-3/2} = -\frac{1}{2x^{3/2}}$$

Rule 2 : Scalar Rule

$$[k \cdot f(x)]' = k \cdot f'(x)$$

\nearrow

Scalar

Rule 3 : Addition Rule

$$[f(x) + g(x)]' = f'(x) + g'(x)$$

$$[f(x) - g(x)]' = f'(x) - g'(x)$$

Rule 4 : constant rule

$$(c)' = 0$$

$$\text{Example : } (2019)' = 0$$

Example : Find $f'(x)$

$$\textcircled{1} \quad f(x) = 9 \cdot x^6$$

\uparrow
scalar

$[9 + x^6]$

\uparrow
not a scalar

$$f'(x) = (9 \cdot x^6)' = 9 (x^6)' = 9 \cdot 6 \cdot x^{6-1}$$

$$= 54 \cdot x^5$$

$$\textcircled{2} \quad f(x) = 7 \cdot x^3$$

scalar
↓

$$f'(x) = (7 \cdot x^3)' = 7(x^3)' = 7 \cdot 3x^{3-1} = 21x^2$$

$$\textcircled{3} \quad f(x) = 7 + x^3$$

addition

$$f'(x) = (7 + x^3)'$$

$$f'(x) = (7)' + (x^3)' = 0 + 3x^{3-1} = 3x^2$$

$$\textcircled{4} \quad f(x) = \underbrace{6x^3}_1 + \underbrace{5x^2}_1 - \underbrace{7x}_1 + 2024$$

$$f'(x) = (6x^3 + 5x^2 - 7x + 2024)'$$

$$= \underbrace{(6x^3)'}_1 + \underbrace{(5x^2)'}_1 - \underbrace{(7x)'}_1 + (2024)'$$

$$= 6 \cdot 3 \cdot x^{3-1} + 5 \cdot 2 \cdot x^{2-1} - 7 + 0$$

$$= \boxed{18x^2 + 10x - 7}$$

Show all the work
as in the example.

Assignment 13

Find $f'(x)$

Do not just give the final
answer.

$$\textcircled{1} \quad f(x) = \frac{1}{x^7}$$

$$\textcircled{2} \quad f(x) = \frac{x^6}{x^{10}}$$

$$\textcircled{3} \quad f(x) = \frac{x^6}{\sqrt{x}}$$

$$\textcircled{4} \quad f(x) = 7x^3$$

$$\textcircled{5} \quad f(x) = 10x^9$$

$$\textcircled{6} \quad f(x) = -5x^2$$

$$\textcircled{7} \quad f(x) = 9x^6 + 6x^2 + 7$$

$$\textcircled{8}$$

$$f(x) = 6x^3 + 4x + 9$$

$$\textcircled{9}$$

$$f(x) = 6\sqrt{x} + x^3$$

$$\textcircled{10} \quad f(x) = \frac{6}{x^2} - \frac{7}{x^3} + 1$$

$$\textcircled{11}$$

$$f(x) = \frac{7}{\sqrt{x}} + x + 1$$

$$\textcircled{12}$$

$$f(x) = \frac{9}{3\sqrt{x}} + \frac{x}{7}$$
